Conference: APS-DFD 2020

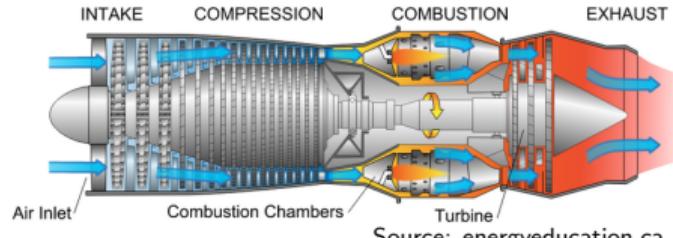

23rd November 2020

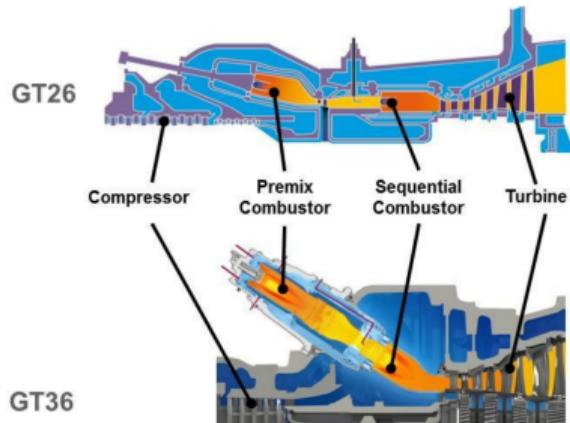

Stationary gas turbine

Features of an ideal gas turbine

- ▶ Fuel flexibility
- ▶ Low emissions
- ▶ High efficiency
- ▶ Wide range of operability
- ▶ High power output

Gas turbine

Source: Ansaldo

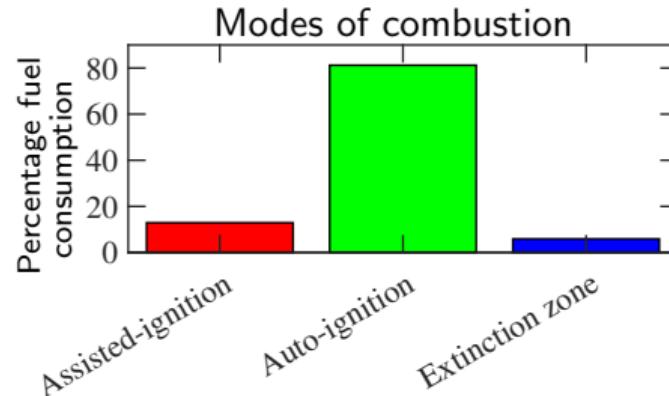

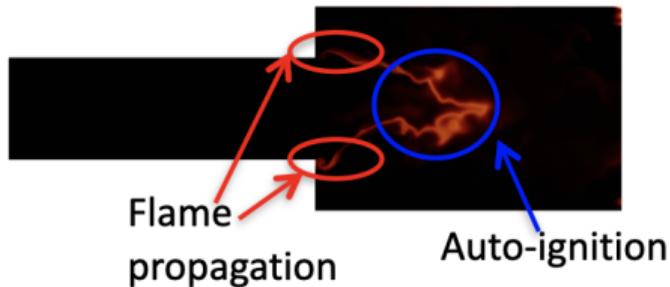

Current state of the art technology in gas turbine

- ▶ NOx EV burner
- ▶ Good fuel flexibility
- ▶ Constant pressure sequential combustion

Literature review

- ▶ *Güthe, F., Hellat, J. (2019), Ciani, A., et al. & Flohr, P. (2009), Bothien, M. R., et al. (2019)*: Used sequential combustion technology to achieve good fuel and operational flexibility
- ▶ *Aditya, K., et al. (2019)*: Explained reheat flame dynamics at 1 bar with the help of 3D DNS and along with intermittent autoignition and occurrence of flame propagation mode

Heat release

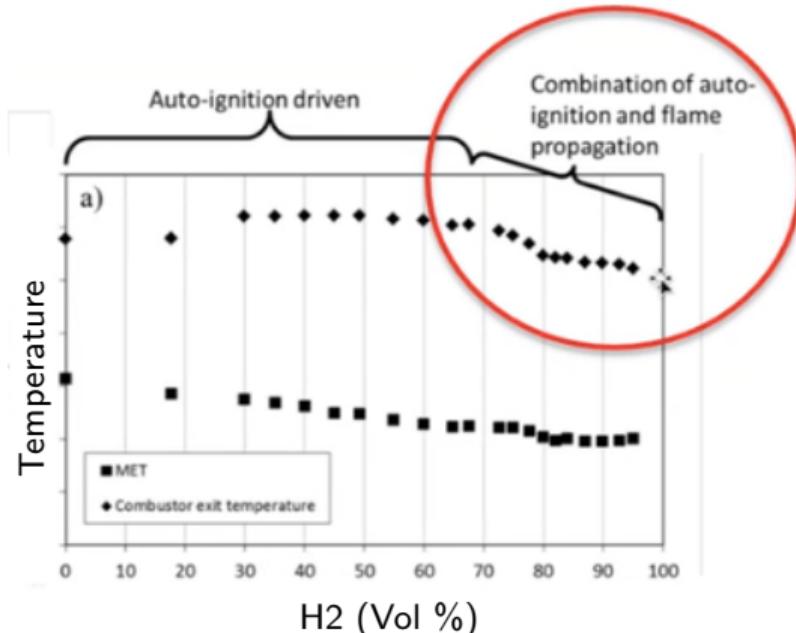

Literature review

- ▶ *Schulz, O., & Noiray, N. (2018)*: Investigated linear and non linear behaviour of heat release rate with respect to entropy waves in a sequential combustor by 3D LES
- ▶ *Gant, F., Scarpato, A., & Bothien, M. R. (2019)*: Explained unsteady behaviour of flame to temperature fluctuations with theoretical analysis and LES
- ▶ *Schulz, O., & Noiray, N. (2019)*: Discussed LES at pressures 1 and 10 bar to explain initial transients of reheat combustor for 3 different cases
- ▶ *Savard, B., et al. (2019)*: Explained mechanism of combustion mode transition from statistically planar premixed flame DNS

Challenges in staged gas turbine

- ▶ Currently its not possible to operate gas turbine with 100% hydrogen fuel without performance compromise
- ▶ Fuel blends are limited for gas turbine operation

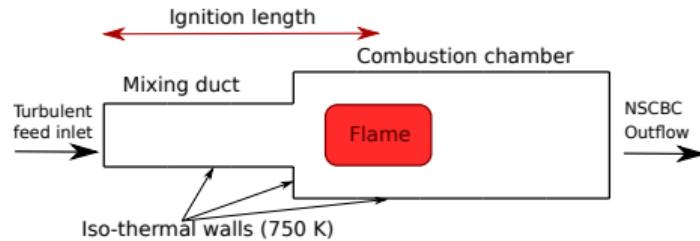

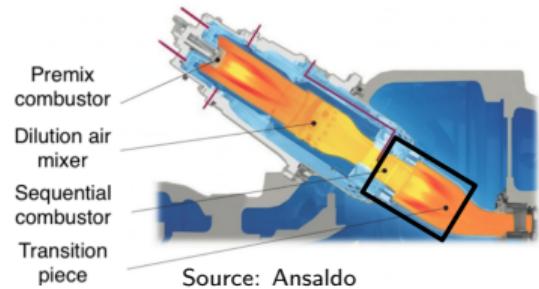

Decrease in combustor exit temperature as hydrogen fraction is increased in reactants¹

¹Mirko R. Bothien, et al. (Journal of Engineering for Gas Turbines and Power 2019)

Objective

- ▶ Two dimensional direct numerical simulation of reheat combustor at various pressures
- ▶ Study the flame structure scaling with pressure
- ▶ Quantify the distribution of fuel consumption rate between the two modes of combustion
 - ▶ Autoignition
 - ▶ Flame propagation

Simulations

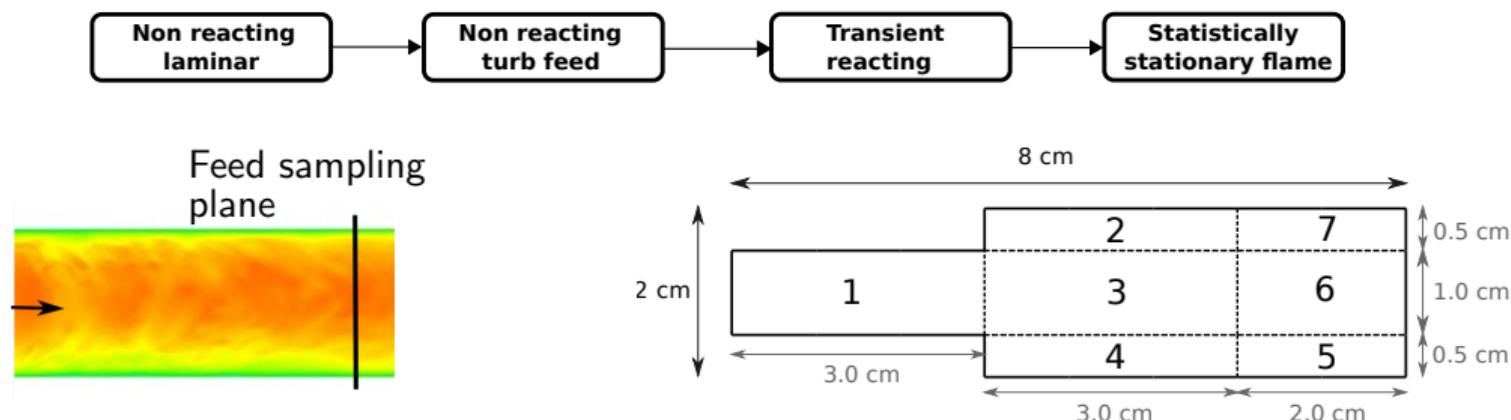

- ▶ Configuration has two parts: mixing duct and combustion chamber
- ▶ Conditions at inlet are such that flame is at a desired location (ignition length) in combustion chamber
- ▶ **S3D-multiblock²:** 8th-order central difference schemes for spatial derivatives
- ▶ Explicit 6-stage, 4th-order Runge-Kutta method for time advancement
- ▶ CHEMKIN and TRANSPORT libraries: compute thermo-chemical and transport properties

²Chen, et al. (Computational Science & Discovery 2009)

Simulation setup

- ▶ Detailed chemistry with 9 species and 21 reactions by Li³ et al. 2004
- ▶ Fully developed channel flow DNS is used for turbulent feed inlet
- ▶ Turbulent velocity feed inlet and non-reflecting Navier-Stokes characteristics boundary condition outflow
- ▶ Isothermal walls (750K) with no slip condition

³Li, et al. (International journal of chemical kinetics 2004)

Simulation parameters

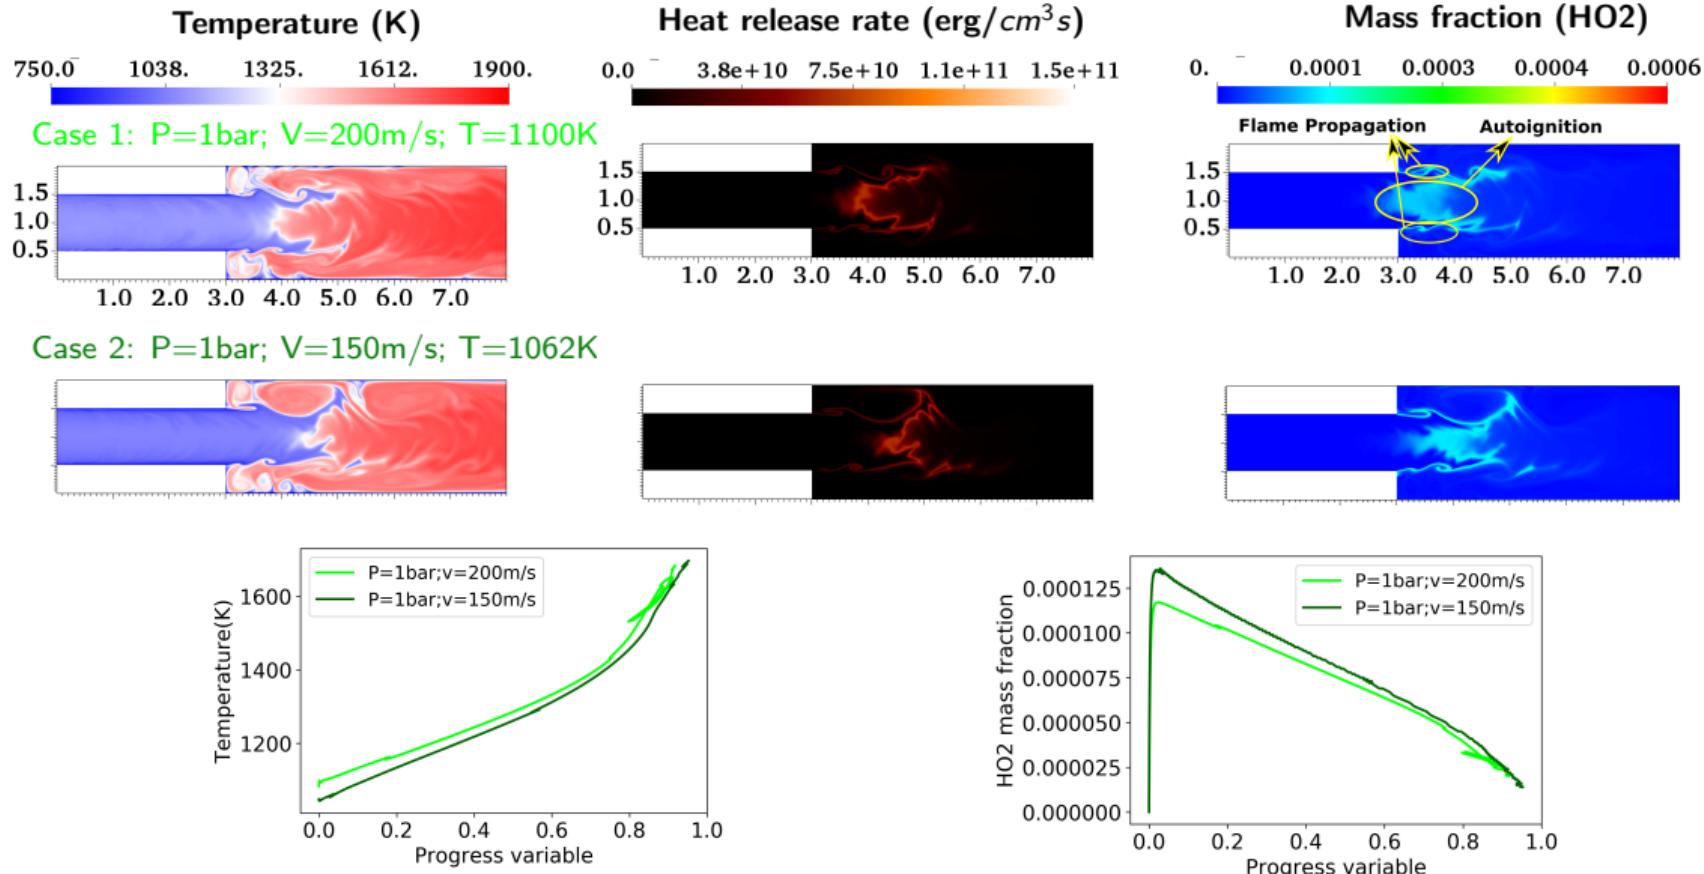

- ▶ 2D simulations were performed on SahasraT (IISc, India) and FRAM (Norway)

Case	Pressure	T_{inlet}	U_{bulk}	Grid resolution	Grid points	Reynolds number
1	1 bar	1100K	200 m/s	22.22 μm	2,308,500	7150
2	1 bar	1062K	150 m/s	22.22 μm	2,308,500	5700
3	5 bar	1132K	150 m/s	8.33 μm	16,560,000	25500
4	10 bar	1182K	150 m/s	5.00 μm	45,600,000	47500

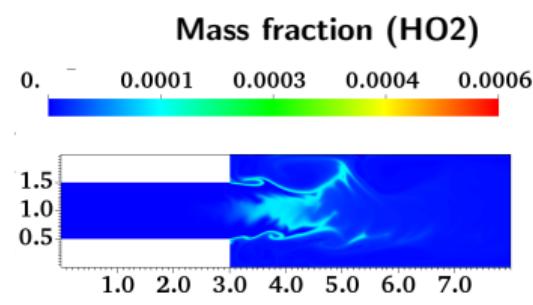

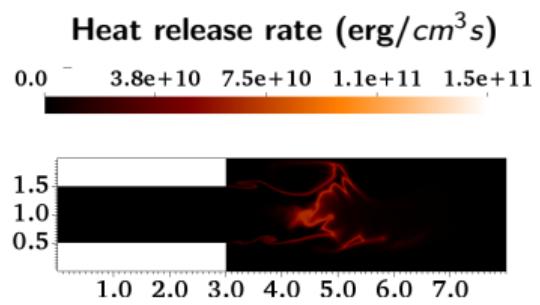

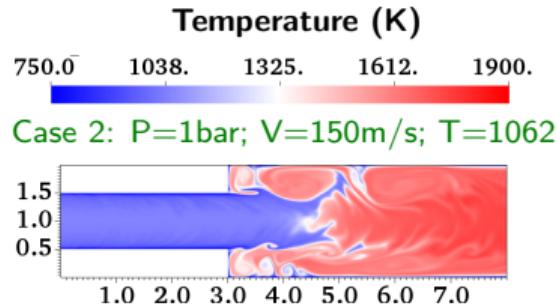

Case 3: $P=5\text{bar}$; $V_{inlet} = 150\text{m/s}$; $T_{inlet} = 1132\text{K}$ video

- ▶ Temperature contours

Effect of residence time on flame structure

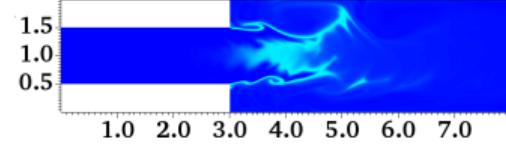

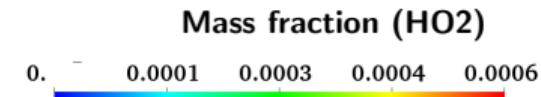

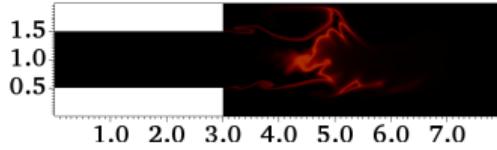

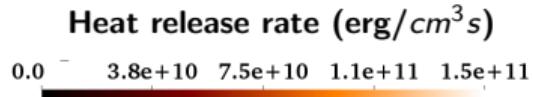

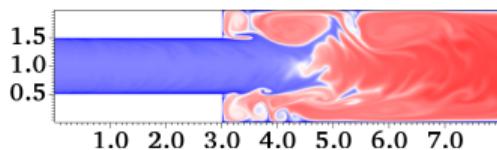

Pressure scaling

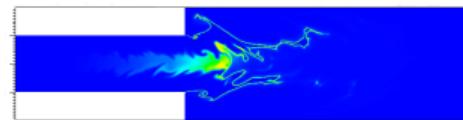

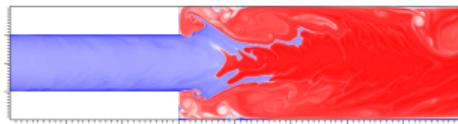

Pressure scaling

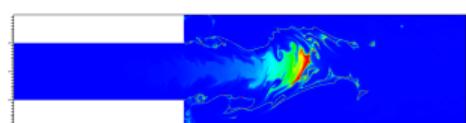

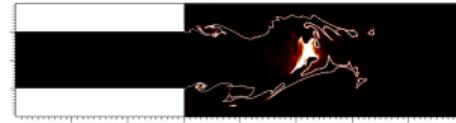

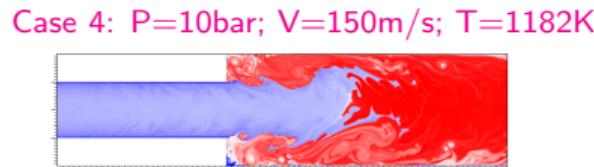

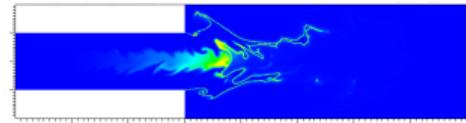

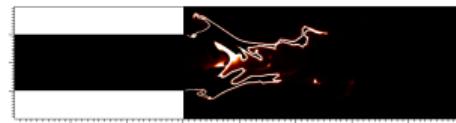

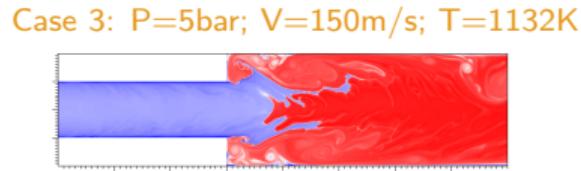

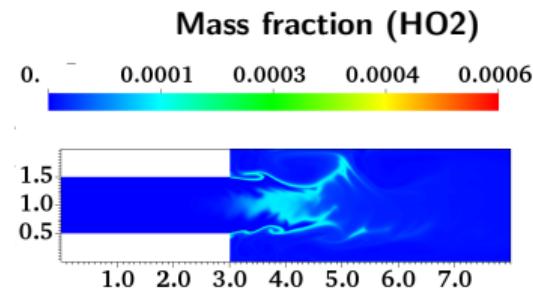

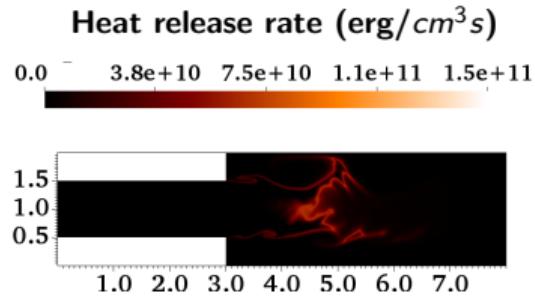

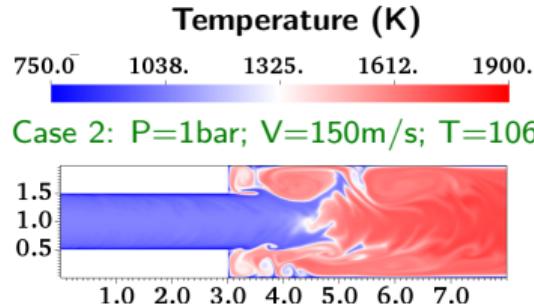

Case 2: $P=1\text{bar}$; $V=150\text{m/s}$; $T=1062\text{K}$

Case 3: $P=5\text{bar}$; $V=150\text{m/s}$; $T=1132\text{K}$

Pressure scaling

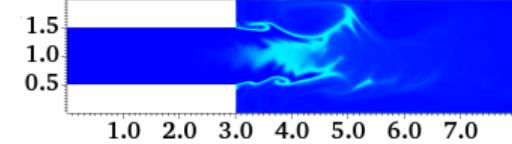

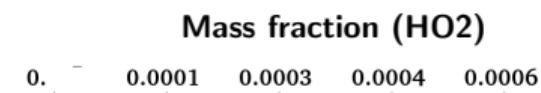

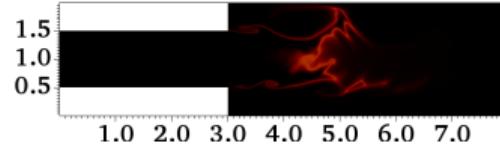

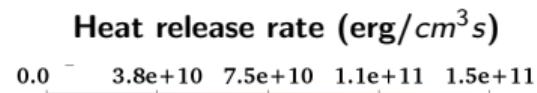

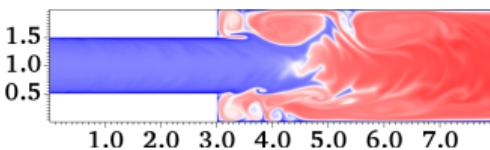

- Thinner flames and enhanced heat release rate at high pressure

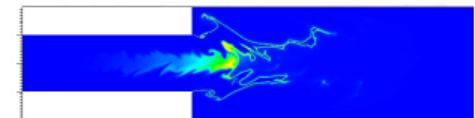

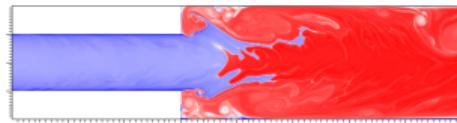

Pressure scaling

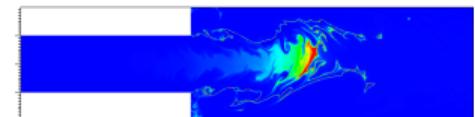

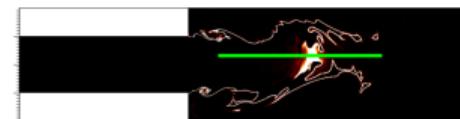

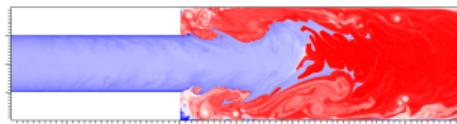

Case 2: $P=1\text{bar}$; $V=150\text{m/s}$; $T=1062\text{K}$

Case 3: $P=5\text{bar}$; $V=150\text{m/s}$; $T=1132\text{K}$

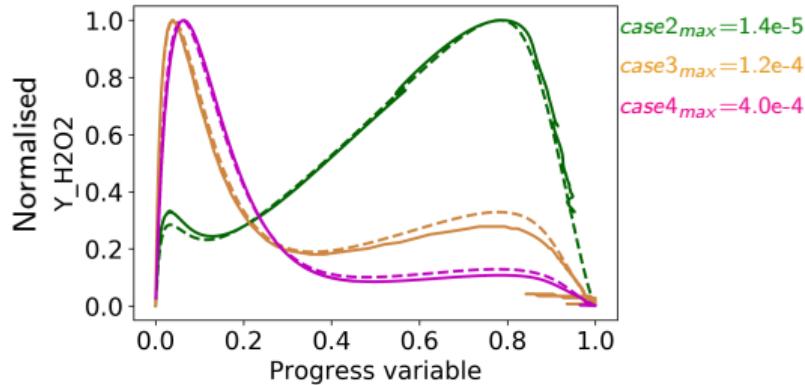

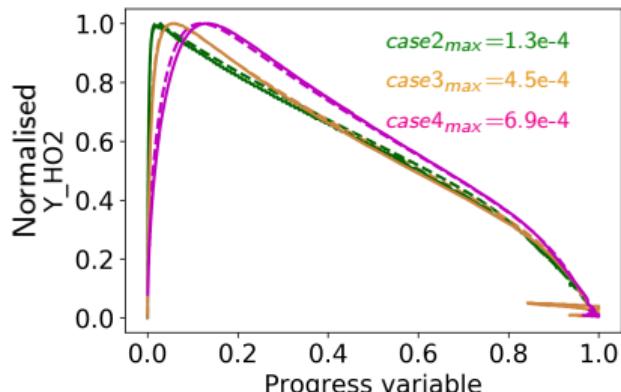

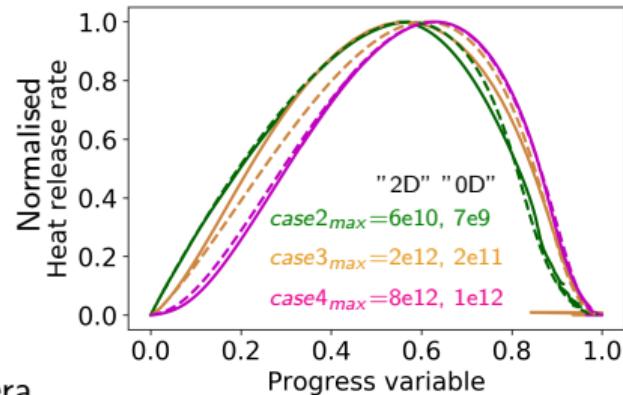

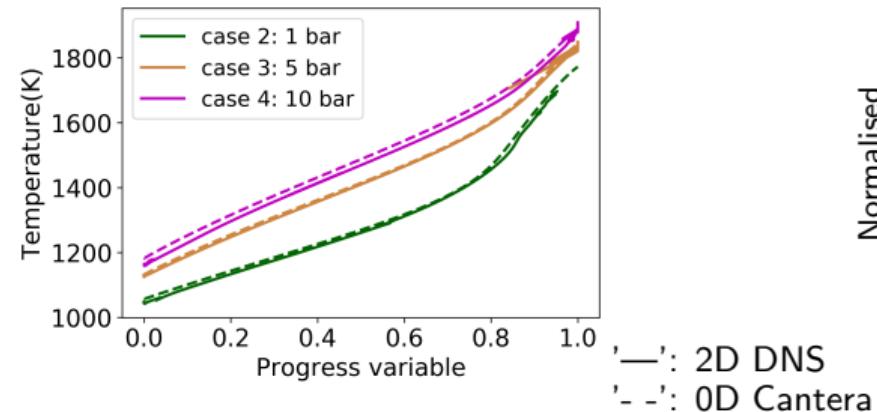

Case 4: $P=10\text{bar}$; $V=150\text{m/s}$; $T=1182\text{K}$

- ▶ Thinner flames and enhanced heat release rate at high pressure

Comparing autoignition from 2D-DNS and 0D-cantera

- ▶ Change in chemical pathway with pressure increase

Time averaged plots

Temperature (K)

750.0 1038. 1325. 1612. 1900.

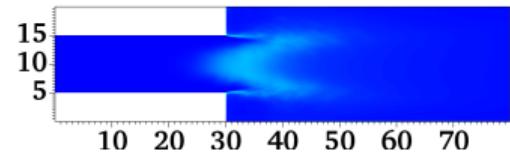

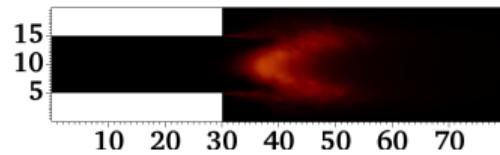

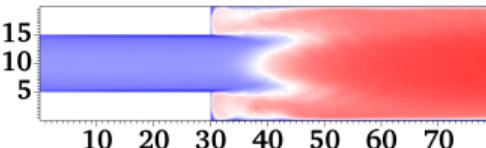

Heat release rate ($\text{erg}/\text{cm}^3\text{s}$)

0.0 2.2e+09 4.5e+09 6.8e+09 9.0e+09

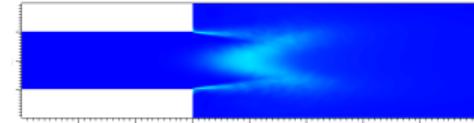

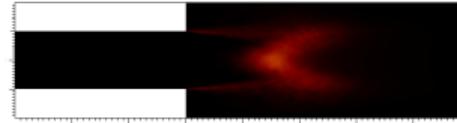

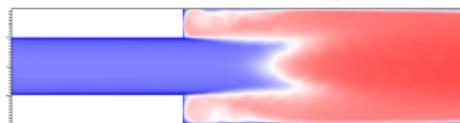

Mass fraction (HO_2)

0. 0.0001 0.0003 0.0004 0.0006

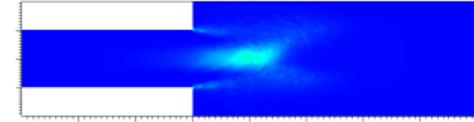

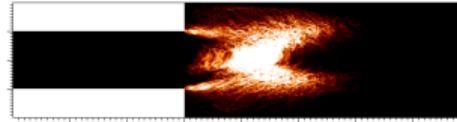

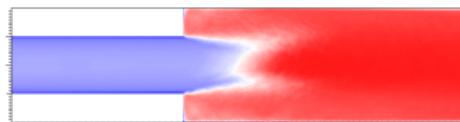

Case 1: $P=1\text{bar}$; $V=200\text{m/s}$; $T=1100\text{K}$

Case 2: $P=1\text{bar}$; $V=150\text{m/s}$; $T=1062\text{K}$

Case 3: $P=5\text{bar}$; $V=150\text{m/s}$; $T=1132\text{K}$

- ▶ Thicker flame brush and greater heat release rate at high pressure

CEMA: Chemical explosive mode analysis⁴

- ▶ CEMA is based on eigen-analysis of the Jacobian of the local chemical source term in the governing equation of a reacting flow
- ▶ Projected chemical source term $\phi_\omega = \mathbf{b} \cdot \boldsymbol{\omega}(\mathbf{y})$
- ▶ Projected non-chemical source term $\phi_s = \mathbf{b} \cdot \mathbf{s}(\mathbf{y})$
- ▶ Ratio $\alpha = \phi_s / \phi_\omega$: scalar variable to distinguish between different modes of combustion

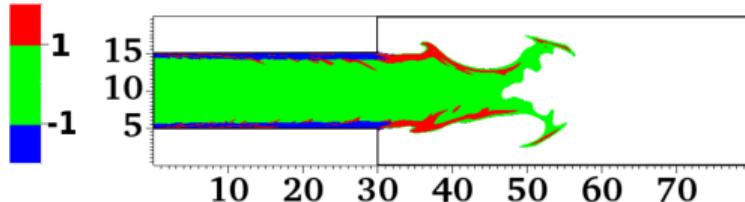

$$\alpha \simeq \frac{\text{diffusion source term}}{\text{reaction source term}}$$

- ▶ $\alpha < -1$: flame extinction
- ▶ $-1 < \alpha < 1$: autoignition
- ▶ $\alpha > 1$: flame propagation

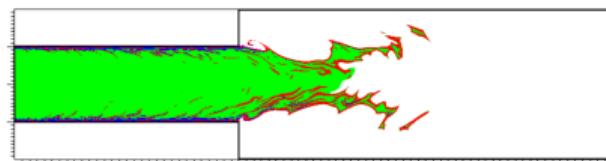

⁴Chao, et al. (Proceedings of the combustion Institute 2019)

Fuel consumption: autoignition vs flame propagation

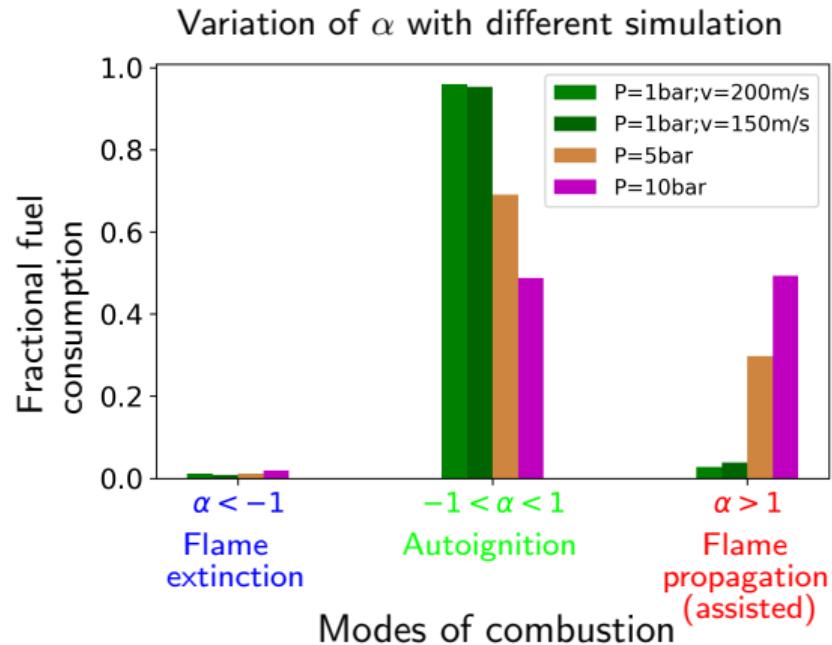

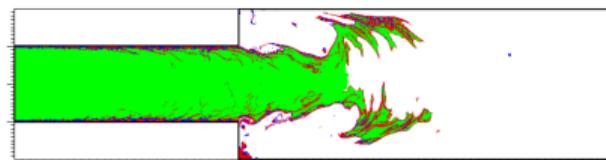

Case 2: $P=1\text{bar}$; $V=150\text{m/s}$; $T=1062\text{K}$

Case 3: $P=5\text{bar}$; $V=150\text{m/s}$; $T=1132\text{K}$

Case 4: $P=10\text{bar}$; $V=150\text{m/s}$; $T=1182\text{K}$

- ▶ Significant reduction in fuel consumption by autoignition mode as pressure increased from 1 bar to 10 bar

Conclusions

- ▶ Performed 2D DNS of reheat combustion at different pressures
- ▶ Investigated the flame structure for autoignition and flame propagation modes
- ▶ Significant increase in heat release rate and temperature at high pressure
- ▶ At high pressure significant reduction in fuel consumption by autoignition
- ▶ Further investigation on pressure scaling of flame structure and fuel consumption is being carried
